

Q&A

I would like to treat my acne problem. How many Spectra Peel sessions do I need before I see results?

You should start to see improvement in your skin tone and a reduction of the acne after the first treatment. However, results will be more dramatic after three or four treatments with a two- to three-week interval. Your physician should be consulted for the frequency of your follow-up treatments.

After pregnancy, I've been left with brown patches on my forehead and cheeks. What can I do to treat this unsightly pigmentation?

Melasma is a very difficult problem to treat. The gold standard for melasma treatment is with appropriate topical creams specially prescribed by a doctor. As a supplementary form of treatment, LaserToning may be recommended. It is also important to avoid the sun as prolonged exposure can limit the effectiveness of your treatments. Take care of your skin by applying sunscreen after any treatments, and whenever you go out. This will help prevent future spots from appearing.

Present this page at Vedure and you'll enjoy a special discount of 15 per cent off when you sign up for the Spectra Laser Package (usual price, \$500). Valid till July 31, 2009. Terms and conditions apply.

PEELING AWAY SKIN WOES

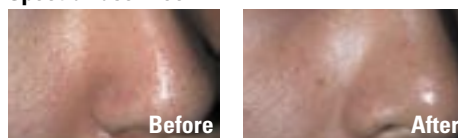

Vedure is a haven for bespoke services and products which resolve a variety of face and body concerns. Besides a host of luxurious treatments, including its non-surgical face-lifting treatment popular with Hollywood celebs, it also has the latest in technology to deal with beauty bugbears such as adult acne and hyper-pigmentation.

The extensive menu of anti-ageing and aesthetics treatments includes the new Spectra Laser Peel treatment which is effective for helping solve acne woes. Using a special photoacoustic technology to control the inflammation of acne, the procedure reduces sebum production and induces skin cell turnover. After applying a Spectra lotion to your skin, the area will be gently stimulated with a laser that will create a peeling effect. This helps to clean away the skin surface and remove the clogged pores to reduce oil production and pore size. Yellow and dark skin also become notably lighter in patients who undergo three or more treatments. Virtually pain free, it has no downtime and has predictable and consistent results (see below).

However, if acne scars are your concern, there's the partially-ablative fractional CO2 laser treatment. This skin resurfacing will put the body's natural collagen production on fast forward by essentially combining the effectiveness of carbon dioxide lasers with an application technique that delivers results without the traditionally harsher side effects. There's downtime of three to five days.
